Your Complete Air Transport Solution For All Of Indonesia

Technical Test

Front-End Developer Candidate · Nuxt Js

This technical test is part of our recruitment process for the Frontend Developer position at Susi Air. Please read this brief carefully before starting and feel free to reach out if anything is unclear.

Project Context

You will be building a small portion of a mobile first web application for pilots. A logbook and schedule companion app that pilots use day to day. For this test, no backend or real integration is required.

Tech Stack (Mandatory)

- **Nuxt Js** with Composition API and `<script setup>`
- **SCSS** for styling
- **Pinia** for state management
- **TypeScript** preferred but not required
- **No backend.** Use mock data JSON file provided. No API calls, no database.

Scope - Screens to Build

Build the following three screens:

1. Sign In page

- Pilot login form (username + password)
- No real authentication. route to Home on submit
- "Need help? Contact CRD" helper link

2. Home page (Dashboard)

- Header: welcome message, pilot name, total flight hours, avatar, notification bell with badge
- Upcoming Flights card showing one mock flight (date, time, departure → arrival with ICAO Code + City)
- Latest News. horizontal scroll with 2-3 mock cards
- Hours to Limit section (see below for full specification)
- My Documents list. Items with expiry badges color coded by urgency :
 - green = more than 30 days
 - amber = less than 30 days
 - red = expired
- Bottom navigation: Home · Schedule · Logbook · More

PT ASI *Pudjiastuti* Aviation

Your Complete Air Transport Solution For All Of Indonesia

3. Schedule page (Calendar)

- Monthly calendar with previous/next navigation
- Days color coded by duty type use these codes:
 - DTY (On Duty)
 - RLV (Requested Leave)
 - SCK (Sick)
 - TRV (Travel Day)
 - TRX (Training)
 - ADM (Administration)
 - FER (Ferry)
 - MED (Medical)
 - REC (Recurrent)
 - ULV (Unpaid Leave)
- Legend displayed below the calendar
- Tapping a date shows a placeholder "Detail page coming soon". No need to build the full detail screen.
- Mock JSON data provided.

Hours to Limit Section (Home page) - Detailed Spec

This is the most complex piece of the Home page. Please read carefully.

A. Limit Summary Cards

Four cards in a row (swipe) or 2x2 grid on narrow screens, each showing the pilot's current hours flown vs. the regulatory limit:

Card	Limit	Sum window
Daily	8 hours	Today only
Weekly	40 hours	Rolling 7 days
Monthly	100 hours	Rolling 30 days
Annual	1050 hours	Rolling 365 days

Each card should clearly show: current hours flown in the window, the limit, and a visual indicator (progress bar, ring, or remaining hours) of how close the pilot is to the limit.

B. Flight Hours Trend Chart

Below the four cards, render a line chart:

- **X-axis:** days (horizontal). Display (7 days before today) + today + (7 days after today). today is always centered.
- **Y-axis:** hours (vertical). Y-max changes based on the selected range toggle (see table below).
- **Red limit line:** drawn horizontally at the limit value for the selected range.
- **Below the chart:** a toggle group with options 1w, 1m, 3m, 6m, 1y. default to 1w.

C. Chart Bounds per Toggle

Toggle	Sum window	Limit line (red)	Chart Y max
1w	Last 7 days	40 hours	45 hours
1m	Last 30 days	100 hours	125 hours
3m	Last 90 days	300 hours	325 hours
6m	Last 180 days	600 hours	625 hours
1y	Last 365 days	1050 hours	1250 hours

D. Calculation Formula (Important)

Each point on the chart is a rolling sum, NOT the hours flown on that single day.

For each date D in the displayed 15-day window (7 days back, today, 7 days forward), the Y value is:

$$Y(D) = \text{sum of flight hours from } (D - \text{windowDays} + 1) \text{ up to and including } D$$

Worked example - today is 15 May:

- Toggle = 1w (window = 7 days). For D = 15 May, sum hours from 9 May to 15 May. For D = 14 May, sum from 8 May to 14 May. Same logic for every date in the displayed range.
- Toggle = 1m (window = 30 days). For D = 15 May, sum hours from 16 April to 15 May. But the X-axis still only displays 7 days before and 7 days after. the window size only changes how each point is calculated, not how many points are shown.
- Same pattern for 3m (90-day window), 6m (180-day window), 1y (365-day window). Display range stays at ± 7 days from today in all cases.

E. Mock Data

A JSON file with 521 days of mock flight hours (27 Dec 2024 to 31 May 2026) is provided alongside this brief. Use it directly, don't generate your own. File: mock-flight-hours.json.

Structure:

```
{ "pilot": {...}, "limits": {...}, "chartBounds": {...}, "flightHours": [{ "date": "2024-12-27",  
  "hours": 3.4 }, ...] }
```

Treat today as 31 May 2026 when developing so the chart has data both behind and ahead. The dataset includes naturally occurring busy periods where the 1w and 1m rolling sums cross the red limit line, your chart should handle and visualize those crossings.

What We're Looking For

- Clean Nuxt Js project structure (pages/, components/, composables/, layouts/)
- Reusable components. don't repeat yourself across screens
- Mobile first responsive design. verify at 390px width
- Sensible Pinia store structure for mock data
- Correct rolling-sum logic for the Hours to Limit chart
- UX details: loading states, transitions, tap feedback
- Working PWA basics is a plus, not required

Design Direction

No mockups will be provided, we want to see your design instincts. Align with the Susi Air brand as seen on susiair.com and [@susiairofficial](https://www.instagram.com/susiairofficial) on Instagram.

Style: minimalist, clean, mobile first, operational/professional. Think airline operations tool, not consumer travel app. Generous whitespace, clear hierarchy, no heavy gradients.

Color Palette

Role	Color
Primary navy	#0E2138
Brand red (CTAs, accents)	#E63757
Background	#F5F6F8
Card surface	#FFFFFF
Text primary	#0E2138
Text secondary	#6B7280
Success	#1FBF8F
Warning	#F59E0B
Danger	#E63757
Chart accent	#22C5E8

PT ASI *Pudjiastuti* Aviation

Your Complete Air Transport Solution For All Of Indonesia

Typography

- **Inter** or **Plus Jakarta Sans** (Google Fonts)
- Bold weights for numerical data, flight hours, times, key metrics
- Body 14 - 16px, labels 12 - 13px, headlines 18 - 22px

Components

- Rounded corners: 12 - 16px on cards, pill shape (24px) on primary buttons
- Subtle card shadows, no heavy drop shadows
- Line icons (Lucide, Phosphor, or Heroicons), 1.5 - 2px stroke
- For the Susi Air logo, use the asset from susiair.com

Other Mock Data Suggestions

- Pilot name: *John Doe* (or your choice, already in the JSON)
- One upcoming flight (e.g. Jakarta HLP → Pangandaran CJN)
- 5 mock documents with varied expiry states
- A schedule month populated with 8 - 10 days of mixed duty types

Deliverables

- **GitHub repository** (public, or invite us if private) with a clear README covering setup, run, and build commands
- **Live deployment URL** on Vercel, Netlify, or similar (free tier is fine)
- **Brief notes** in the README: what you'd do differently with more time, libraries you chose and why

Timeline

Please submit within **3 calendar days** of receiving this brief.

Submission

Send your GitHub repository link and live deployment URL to it.admin@susiair.com.
